Radio Link engineering begins by doing a link budget analysis. A given radio system has a system gain that depends on the design of the radio and the modulation used. The gains from the antenna at each end are added to this gain. Larger antennas provide higher gain. The free-space loss of the radio signal as it

The evolution of microwave radio systems continues, with significant progress made over the last decade. Modern systems support parallel TDM and Ethernet transmission and more recently, all packet based systems have been introduced. This evolution is aligned with the general telecoms shift from TDM to all-IP networking.

A history of point to point digital microwave radio systems

In microwave radio relay, microwaves are transmitted on a line of sight path between relay stations using directional antennas, forming a fixed radio connection between the two points. The requirement of a line of sight limits the separation between stations to the visual horizon, about 30 to 50 miles (48 to 80 km).
