Dehydrogenation
In this scenario, routes to obtain propylene from lighter feedstock, instead of from crude oil, are becoming more and more interesting. Thus the propane dehydrogenation (PDH) reaction is a promising alternative to meet the rising global propylene demand (see Making Propylene On-Purpose; this

The tight propylene market contributed to the rising of new and novel lower-cost chemical processes for on-purpose propylene production technologies. Propane Dehydrogenation (PDH) technology is one of the promising processes that arises to fulfill this need. This report analyzes a PDH process similar to UOP Oleflex.

Oxidative dehydrogenation of propane is of particular importance with propane being a main component of natural gas. This makes propane a preferable raw material, to be a substitute of naphtha in the manufacturing of propylene.

Direct propane dehydrogenation (PDH) is an attractive technology for propylene production. We show here that propane conversion is significantly enhanced by the addition of ZnO to Cr₂O₃. Furthermore, its activity is strongly dependent on the Zn/Cr molar ratio and one with Zn/Cr = 0.3 gives the highest propane conversion and propylene
